

## Cleanstar assists in the clean-up of Cyclone Debbie

Cleanstar has sent all of its XPOWER airmovers and airscrubbers to Northern Queensland to assist in the drying and clean-up of the areas affected by the tragic Cyclone Debbie.

Xpower Airmovers/Dryers are used to dry up areas to avoid mould and mildew which cause serious health concerns.

The Xpower Air Scrubbers are a portable filtration system that removes contaminants from the air such as mould and dust.

"We are happy that we have products to help assist in the clean-up effort and our deep concerns and thoughts go out to all affected as Airlie Beach is close to our hearts here at Cleanstar," the company said.

In light of this devastation Cleanstar will be donating money to help the communities.

## Aussie Pumps responds to market demand

Aussie Pumps has reported an increase in demand following the launch of its hydraulic, heavy-duty, high pressure cleaning machine range, which it says is safer and more efficient than conventional cleaning equipment.

"We've experienced huge sales growth of hydraulic drive pressure cleaners since the introduction of the product range, with demand largely coming from the drilling and construction markets," said Aussie Pumps' product manager Hamish Lorenz.

"Recently, we have focused on the drilling industry, realising that hydraulics are intrinsically safer than electric, and more convenient, than engine drive."

The range includes machines from 3000 psi through to 7300 psi.

"With flows of up to 120 litres per minute, hydraulic drive blasters have all the features and benefits of a conventional pressure cleaner but come with significant advantages over petrol or diesel machines," said Lorenz.

"For a start they are quiet, don't blow fumes or exhaust and are inherently safe. Depending on the parent power supply, they have almost unlimited grunt compared to conventional engine drive systems."

Aussie Pumps has matched up its 'Big Berty' Bertolini heavy duty triplex pumps with the hydraulic motors to provide a compact high-pressure water blaster kit that can be mounted in a cabinet or installed in a trolley, depending on the application.

"Hydraulic drive lends itself to material processing applications where power is available and the pump can be mounted remotely from the control station," said Lorenz.

"Conveyer belts, dust suppression systems and even hydro demolition are natural applications for hydraulic drive high pressure systems. The operator can work remotely from the machine which is safer and isolates the work station."

All machines come with the Aussie ASP (safety protection) kit that includes an unloader, thermal dump and safety valve, and all units feature an exclusive reinforced Teflon sealing system for long operational life and wear resistance.
